

Synthetic Turf Maintenance

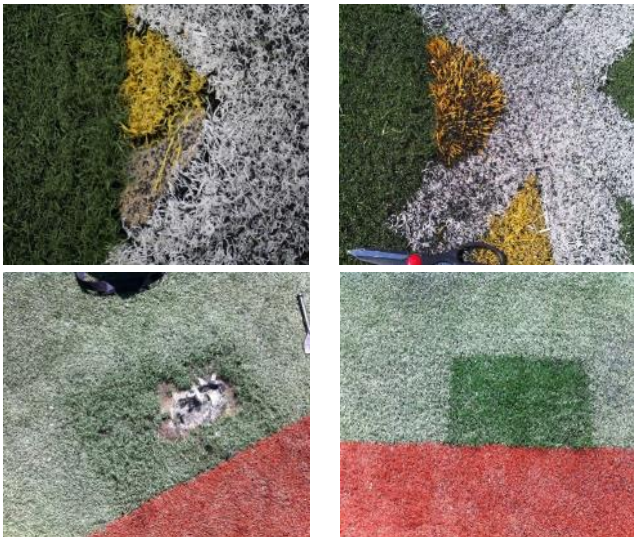

Turf Maintenance 101

The synthetic in-fill turf industry has evolved over the past ten years, and so have the turf's maintenance requirements. Contaminants of many types find their way into the in-fill systems and detrimentally effect their integrity which lessens the life of the system. The *typical* grooming process does not remove contaminants, but instead redistributes them throughout the field. Turf, Track, & Court, LLC's service extracts field contaminants, de-compacts the infill and can potentially increase a new field's usable life by 20-25% (2 - 3 years).

Contaminants Removed

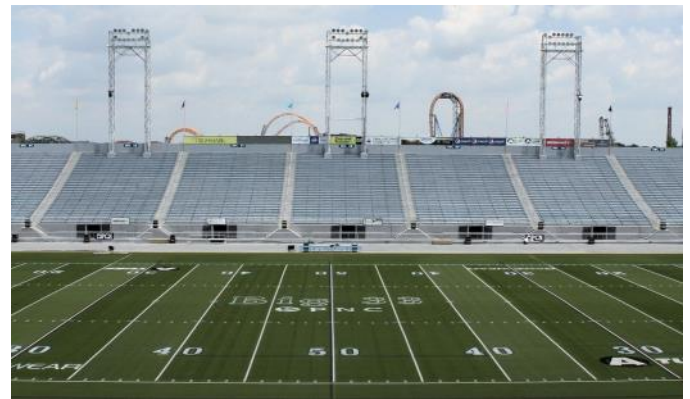

Conditions Repaired

Benefits of Turf Maintenance

- Removes hard, potentially dangerous contaminants (track spikes, bobby pins, safety pins, stones, buttons, earrings, rings, and other various metal, plastic & glass).
- Extracts fine dust particles such as pollen, dust, and dander as well as organic matter, grass, leaves, hair, and clothing fibers.
- Grooms turf fibers vertical, therefore, keeping the wear areas on the ends of the fibers and not on its sides.

Field Striping (HersheyPark Stadium)

Turf Maintenance Services

- State of Art Turf Deep Cleaning
- Top Dressing Infill Material
- Seam / Wrinkle Repairs
- Field Base Repairs
- Line Painting / Graphics
